

Team Name: sdmay24-49

Team Members: Akpobari Godpower, Alex Vongphandy, Abram Demo, Drake Rippey

Report Period: Oct 9-Oct 22

Summary of Progress in this Period

During this period, we developed a prototype assessment configuration site that would allow the professor to enter the different topics they would like to include on the exam. The assessment configuration also included features to develop example prompts so the instructor has a good idea of the possible generated questions in the chat.

Pending Issues

We are working towards developing a database schema that could store the messages from the chat. The goal is to serialize each message and response and save them within a json format to be stored in a database.

Plans for Upcoming Reporting Period

Aside design decisions for the database schema, we also plan to integrate unit testing into the question generation testing and the follow up question generation. We will also investigate different testing technologies to be able to conduct UI testing on the chainlit interface.
